In order to make the HE intuitive to use for inexperienced drivers, SimuRide includes many features that compare to the physics of a real car by employing inertia and the friction of tires with a road. SimuRide also incorporates simulation of the complex physics of a vehicle and many non-ride-related features, such as a race mode, a function to study the collision behavior of a car and its response to different drivers and situations, along with the ability to configure the user-defined driving dynamics. SimuRide also uses the new dual-clutch transmission type developed by the Nissan GT-R driver prototype. The transmission is designed to make it possible to achieve high-speed launches and more precise high-speed transmissions. The HE combines the aspects of a game and a game-based training tool. SimuRide's design was inspired by modern racing games, such as Gran Turismo. The HE's three hardware requirements are: a , processor, 2 gigahertz (GHz) or more of RAM, and an x86 processor with more than 3.0 gigahertz (GHz) of clock speed.

SimuRide includes a full simulation of chassis dynamics as in GT-R, and features a pre-collision system that uses vehicle dynamics and a collision detection system, like in Gran Turismo, in order to enable safe, detailed collisions. SimuRide's collision system is an integrated multi-vehicle collision system which includes a collision prediction system which predicts the future trajectory of the vehicle colliding with another vehicle, and a collision prevention system which detects the trajectory of the vehicle immediately before a collision and prevents the collision from occurring.

SimuRide was built by GReddy, a company owned by Nissan. GReddy is based in Japan. SimuRide has a user's manual and there is a forum for users to share their experiences. Software SimuRide Software, like Gran Turismo, is a game where the player is given a chance to compete against another player or against a computer. The software is geared towards beginners. Features The following are some of the features of SimuRide: Road simulation The SimuRide software allows the driver to race on a realistic road environment. It utilizes a special car model, the F35
