Category:AutoCADManometry of the upper esophageal sphincter (UES) in patients with achalasia of the esophagus. The aim of this study was to describe manometry parameters of the esophageal body in patients with achalasia. Thirty-four patients with achalasia and 20 healthy volunteers were examined by high-resolution manometry. Pressure parameters were grouped into the following 3 subgroups: (1) phasic (transient) pressure (pressure change during the pharyngeal swallow); (2) integral (maximum value of the phasic pressure curve); (3) amplitude (difference between the first and the highest peak pressure value of the phasic pressure curve); (4) duration (interval between the first and the highest peak pressure value of the phasic pressure curve); (5) pressure above 20 mm Hg (critical value of the phasic pressure curve) and (6) maximum pressure (pressure above 20 mm Hg). The following subgroup parameters were statistically analyzed in patients with achalasia: (1) phasic pressure; (2) integral; (3) amplitude; (4) duration; (5) pressure above 20 mm Hg; (6) maximum pressure. The results revealed that subgroup parameters of phasic pressure, amplitude and duration were significantly decreased in patients with achalasia. The subgroup parameters of the integral pressure and the maximum pressure were higher in patients with achalasia than in controls. The most severe dysphagia was
